Red Scarlet	Sava		<u>Reet</u>	Changed scorings	
Secura	VanGogh		<u>Remarka</u>		
<u>Victoria</u>	Vigri		V. kollane		

# Stability concepts

- | Static concept - using the environmental variance, a desirable genotype will not react in changing environmental conditions
- | Measurement of stability of absolute values RS
  
- | Dynamic concept - all genotypes react similarly on the changes of the environment, only the deviations of a genotype from this general reaction are considered as a contribution to instability
- | Stability is defined in relation to the varieties under test. Dependence from selected varieties. Selection of varieties influence results RNS

A photograph of a wheat field under a cloudy sky. The field is filled with tall, green wheat plants. In the background, there is a line of trees and a clear blue sky above.

# Parametric stability analyses

- | Normal distribution and
- | homogenous variance are needed
- | The analyse should be statistically valid in case of large numbers of genotypes, environments and replications, with no outliers of either genotypic or environmental effects and with homogeneous error variances of genotypes,

# Nonparametric stability analyses

## Measure stability according to dynamic concept

- | Rank analyses
- | No requirements for distribution
- | Not affected by outliers
- | Less sensitive to errors of measurements
- | Missing values are permitted

A photograph showing a wide expanse of a wheat field. The wheat plants are tall and green, with some yellowing at the top. In the background, there's a line of trees and a sky filled with white and grey clouds.

# Geometrical methods

- | Represent each genotype by a point in some Euclidean space so that genotypes which are similar to one other are represented by points which are close together
- | Principal coordinates analysis, non-metric multidimensional scaling, biplot method
- | Numerical-geometrical analyse
- | Additive main effects and multiplicative interaction (AMMI) model

# Peer review articles on stability of late blight resistance

- Haynes et al., 2002 Foliar Resistance to Late Blight  
in Potato Clones Evaluated in National Trials in 1997

- mean absolute rank difference
- variance of the rank
- box and whisker plot of ranks

- Flier, van den Bosch, Turkensteen 2003 Stability of partial resistance in potato cultivars exposed to aggressive strains of *Phytophthora infestans*

- ANOVA

- Forbes et al., 2005. Stability of resistance to  
*Phytophthora infestans* in potato: an international evaluation

- mean absolute rank difference
- variance of the rank
- AMMI

AUDPC was used in all trials

A photograph of a potato field under a cloudy sky. The field is filled with green potato plants, showing some variation in height and color. In the background, a line of trees is visible under a blue sky with white clouds.

# Limitations of stability analyses

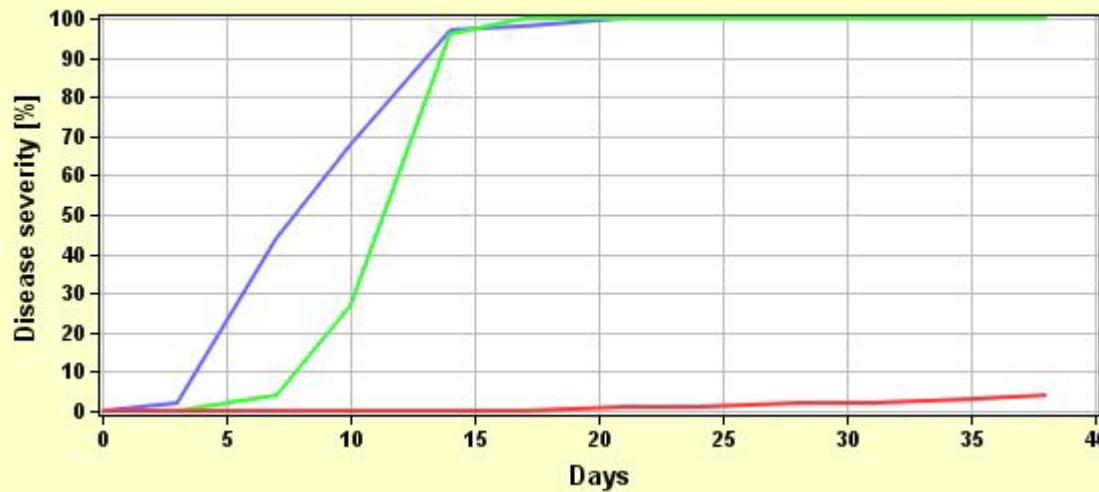

- | Valid within the same set of varieties
- | Non repeatable
- | Trials for analysing stability of late blight resistance in potato varieties are complicated and expensive

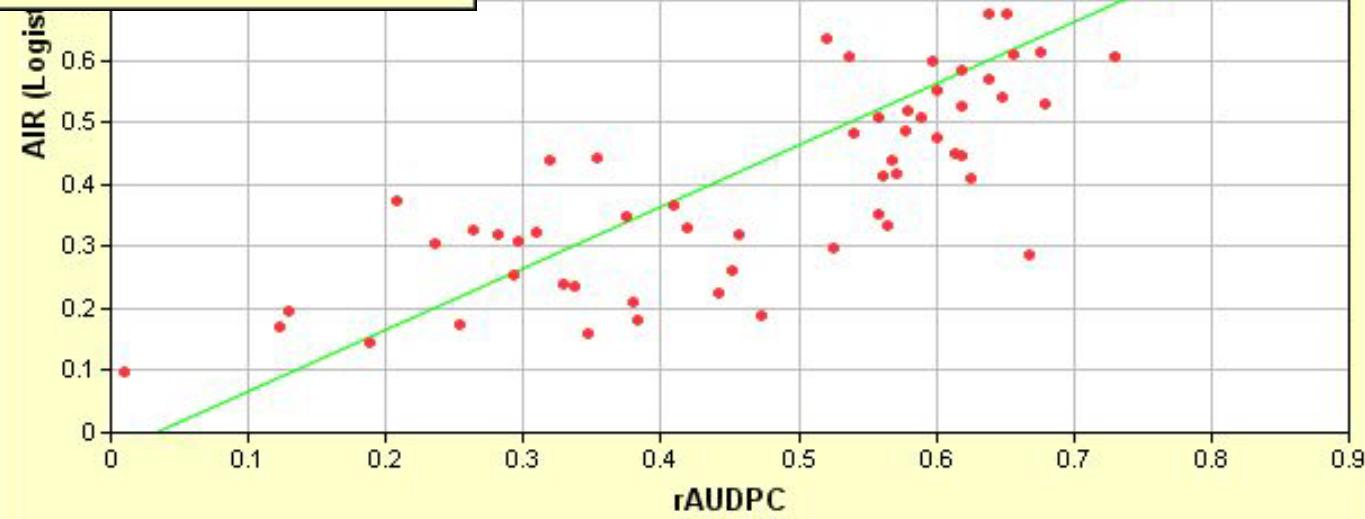

# Exspression of late blight resistance

R 8    R 3    Aminca

2005\_EE\_05\_01

Slope: 0,9936 | Intercept: -0,0332 | Correlation: 0,8057 | Std Error: 0,1343

# Delta method

**Delta t - difference between Days until 1% for the cultivar tested and Days until 1% for Bintje**

**Delta a - difference between AIR for the cultivar tested and AIR for Bintje**

**Susceptible cultivars:** Same or a higher AIRr and less number of Days until 1 % disease than Bintje.

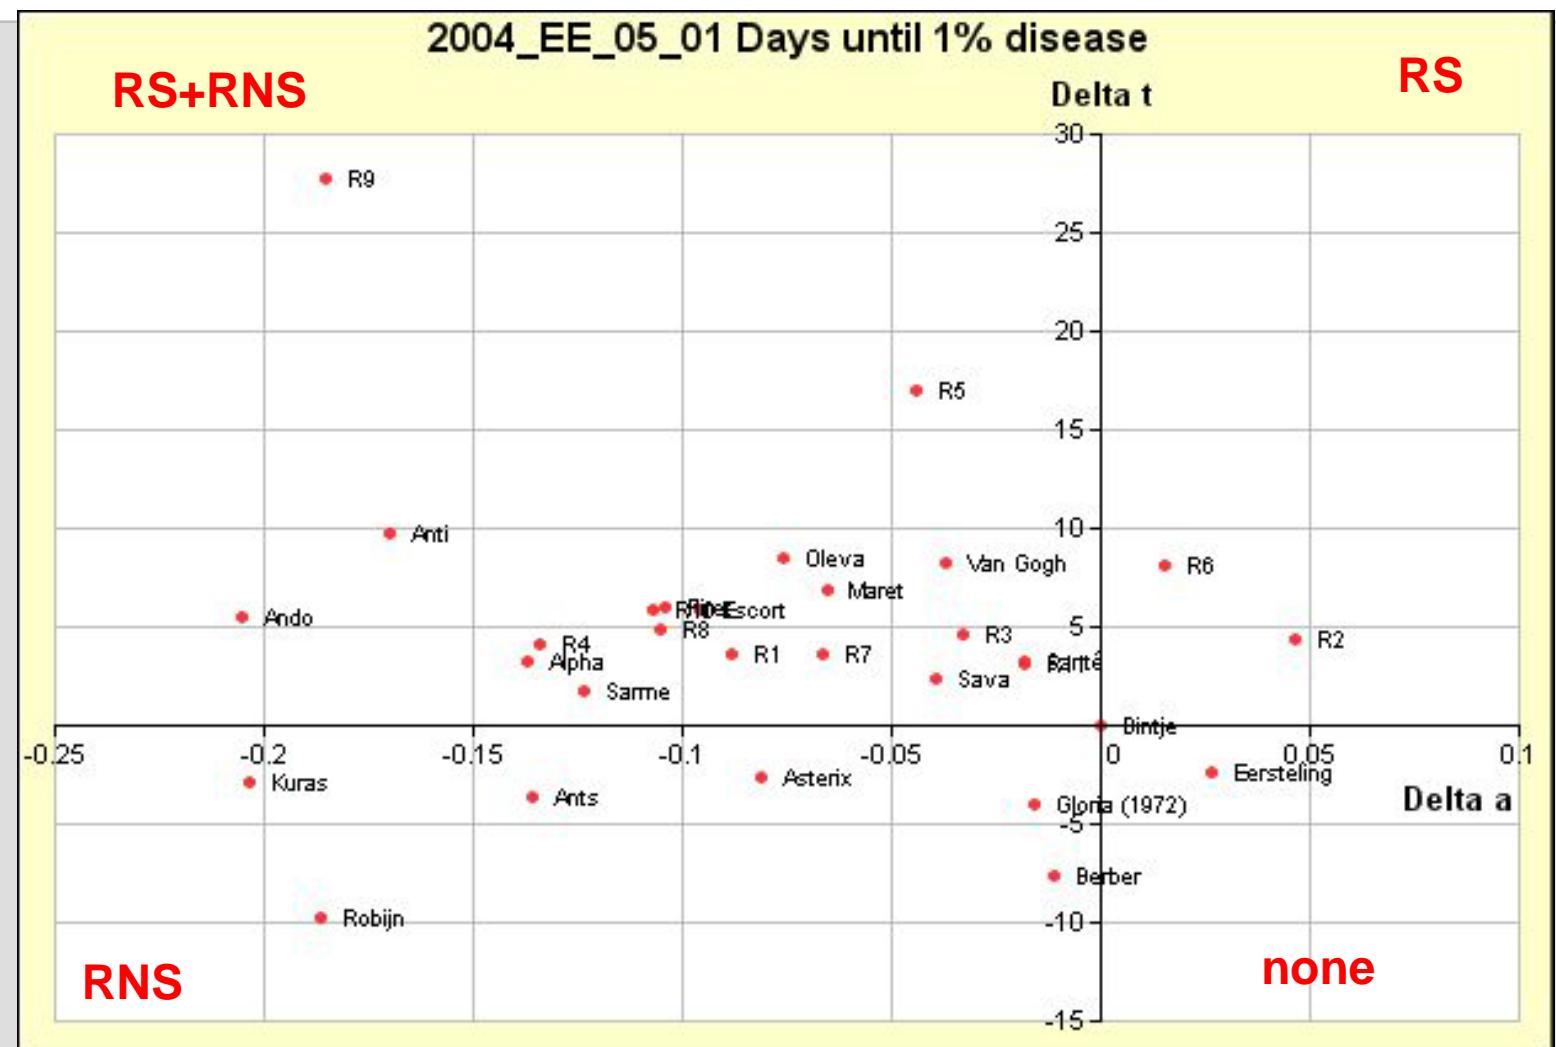

**Race-specific cultivars (RS):** Same or a higher AIR and more Days until 1 % disease than Bintje.

**Race-non-specific cultivars (RNS):** Lower AIR and the same or less number of Days until 1 % disease than Bintje.

**RS + RNS (or RS not overcome):** Lower AIR and more Days until 1 % disease than Bintje.

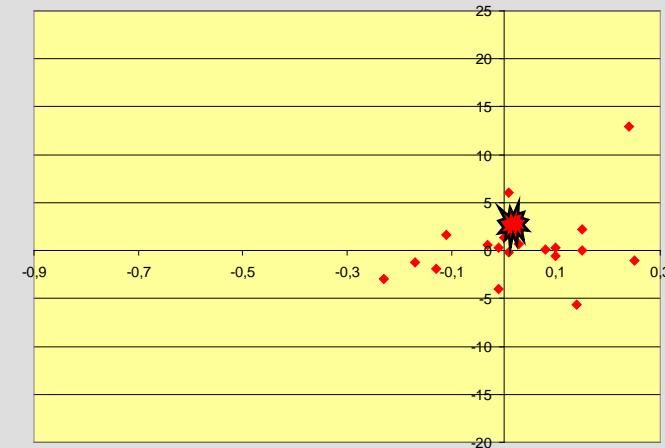

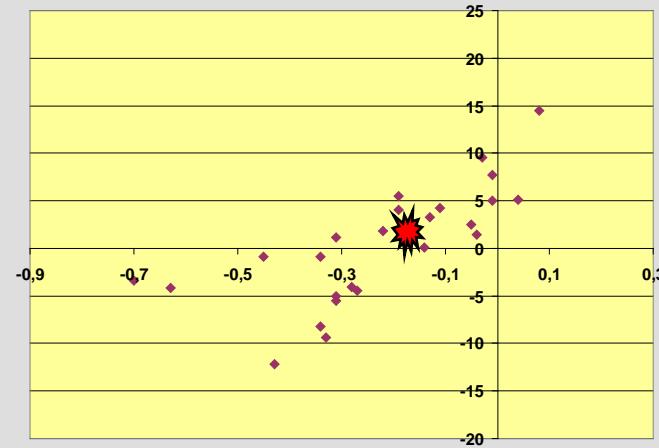

# Delta plot (delta t – delta a)

# Delta plots based on EUCABLIGHT data

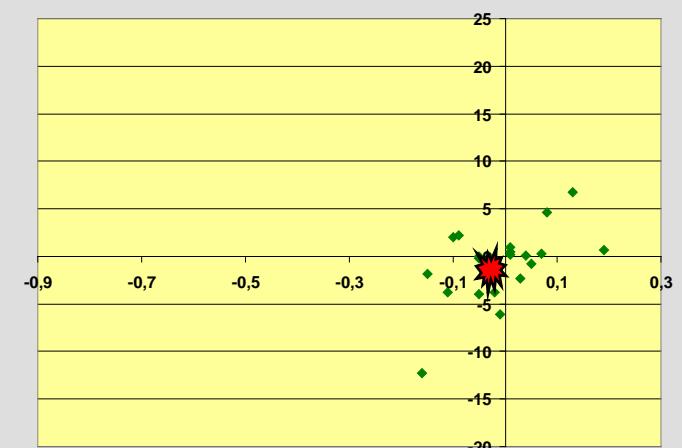

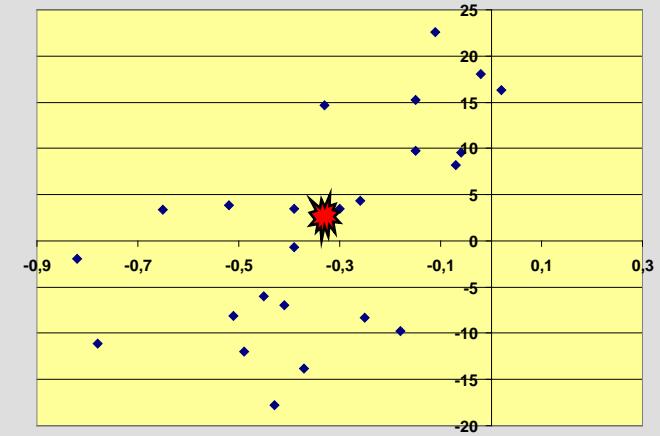

**Alpha N=25 Stdv 6.2; 0.20**

**Gloria N=20 Stdv 3.85; 0.13**

**Robijn N=24 Stdv 11.2; 0.23**

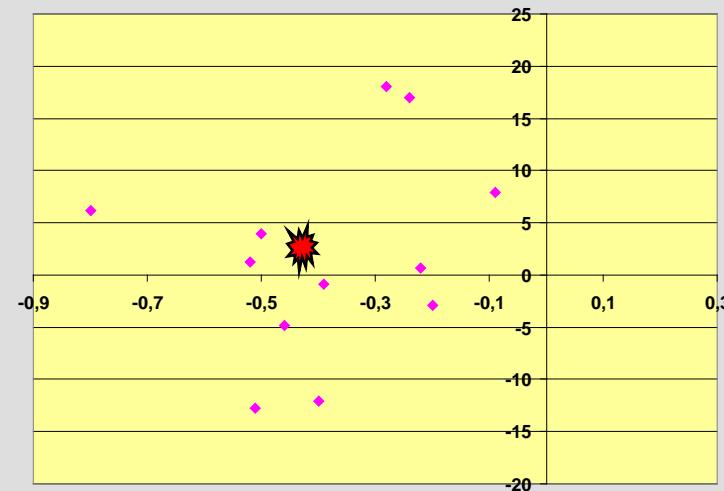

**Eersteling N=21 Stdv 3.91; 0.09**

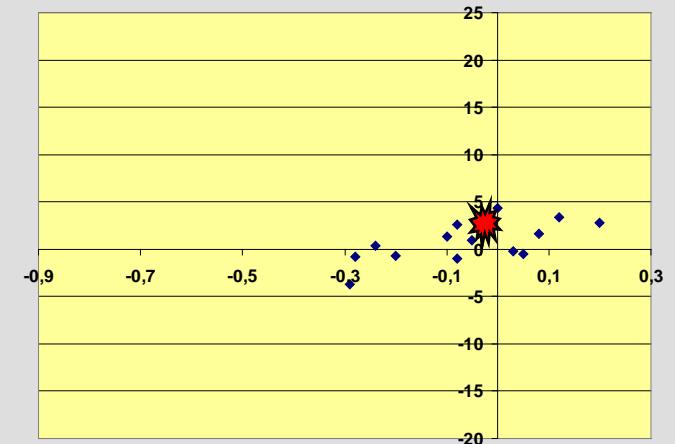

# Resistance stability in EUCLIGHT network

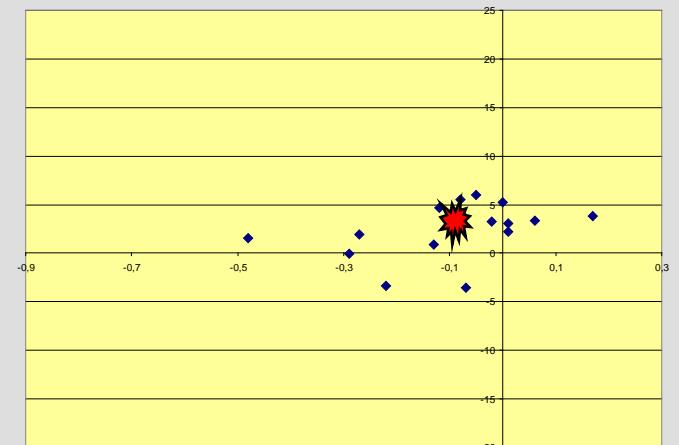

Kuras N`14 Stdv 13.2; 0.18

Premiere N=14 Stdv 2.11; 0.15

Sante N=14 Stdv 2.81 0,16

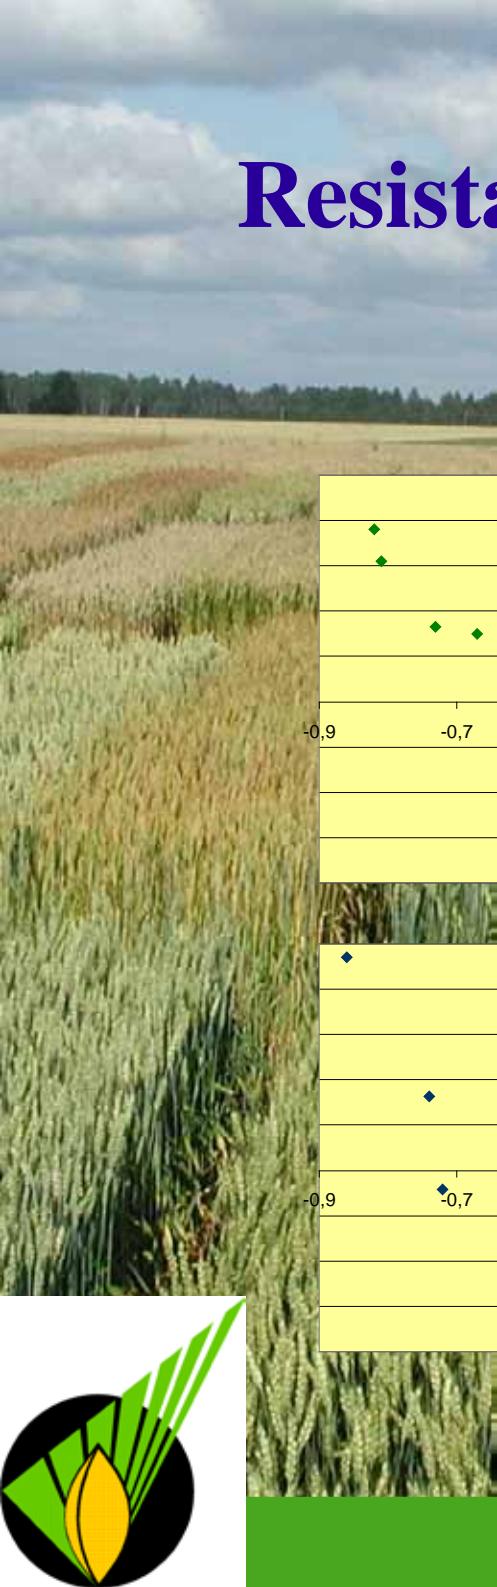

# Variation in 1-9 point scale values

	Average	Range
Alpha	3.8	3,2-5.1
Gloria	2.5	2.3-2.9
Eersteling	2.7	2.2-3.1
Robijn	6.0	4.7-7.2
Kuras	6.6	3.4-7.7

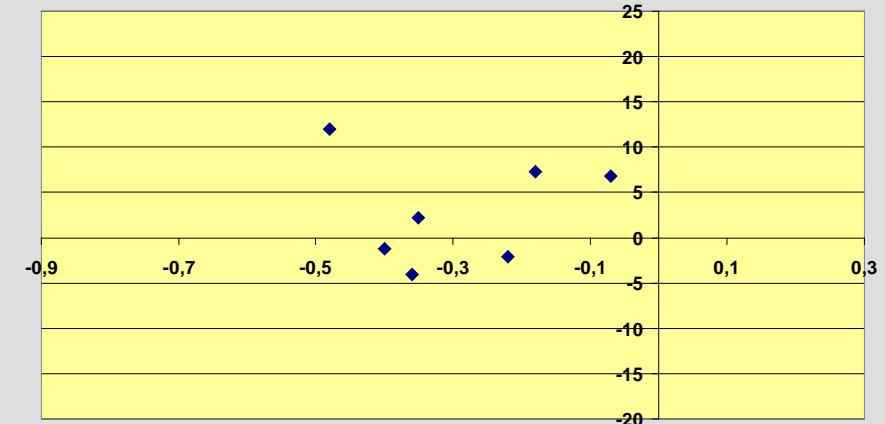

# Resistance stability of Estonian varieties (N=7)

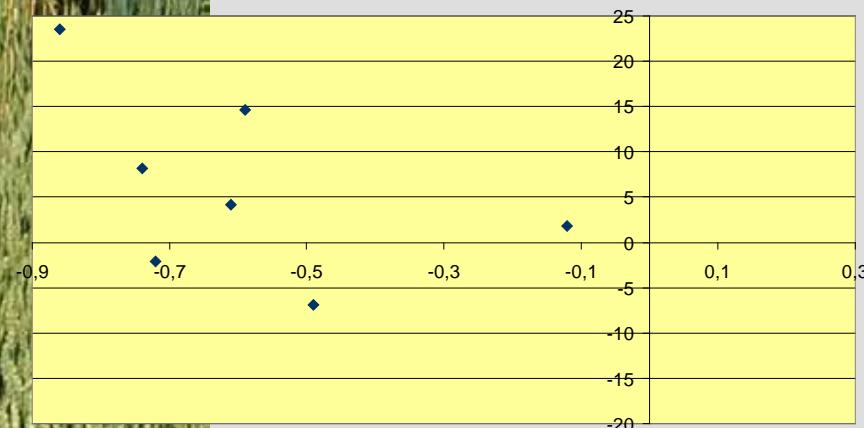

**Ando Stdv 9,78; 0,21**

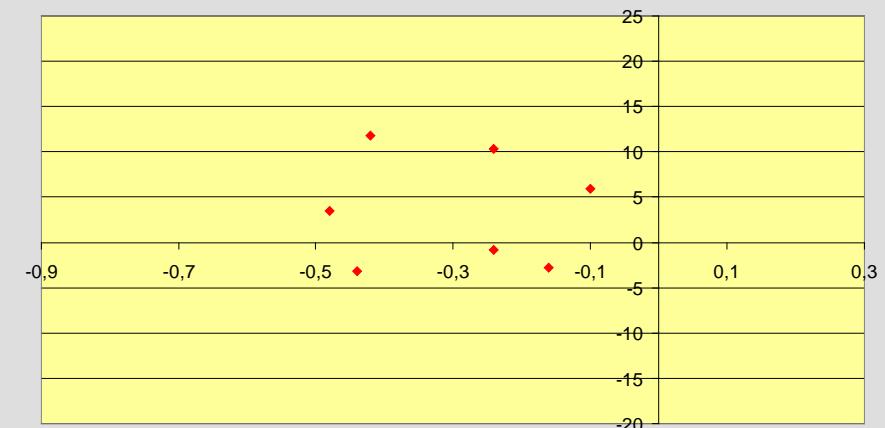

**Maret Stdv 5,90; 0,14**

**Sarme Stdv 10.30; 0,23**

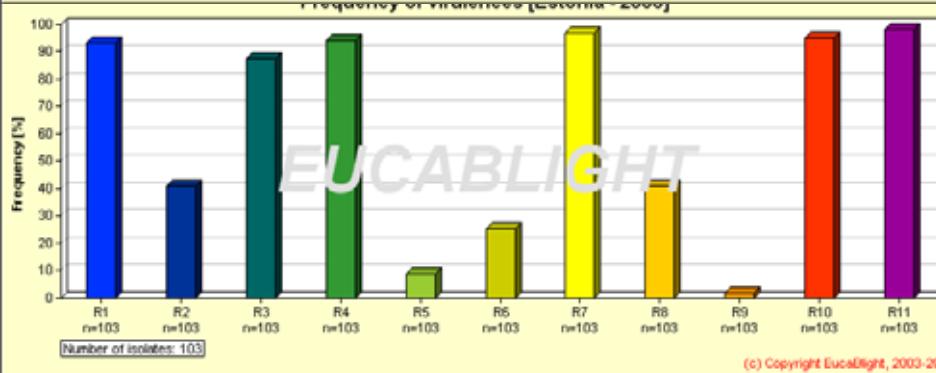

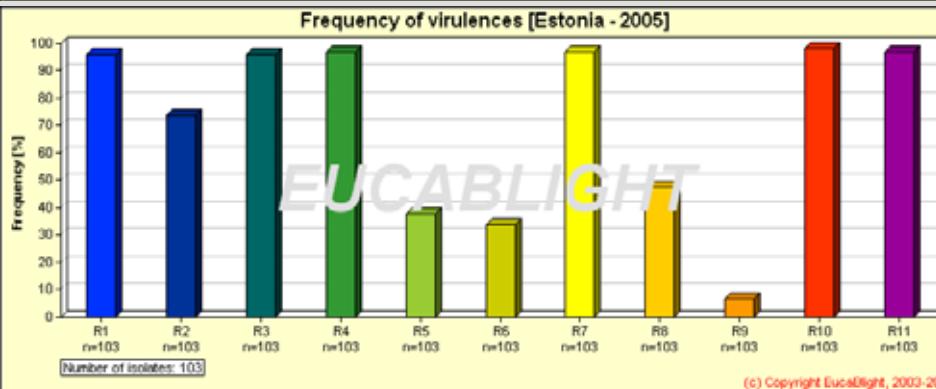

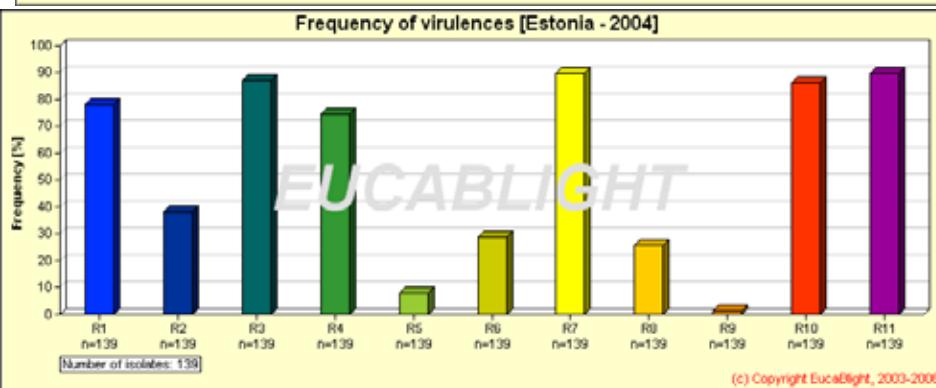

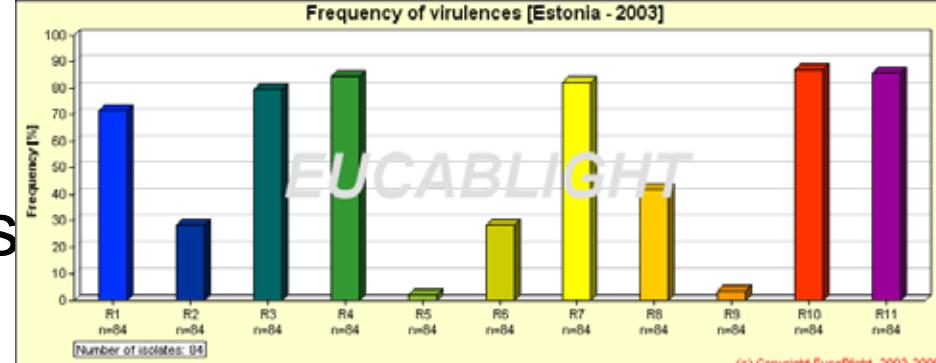

**Piret Stdv 6.10; 0,15**

# Virulence of *P. infestans* isolates
